ABSTRACT

This thesis examines the current policy and procedures used to manage naval aviation configuration control. It recommends that the Navy consult with SABRE Decision Technologies, or a company with a similar background, to re-engineer the process for approving configuration changes and create an information technology system to manage the process.

During this study, I have identified two major challenges to naval aviation configuration policy. They are: (1) the process used to review and approve Engineering Change Proposals (ECPs) is too complex and has too many stakeholders and (2) the current method for management of approved configuration changes is man-hour intensive, has potential for administrative error, and requires physical inspection to positively verify aircraft and equipment configurations.

Finally, this study presents the theory that there are many common requirements between naval aviation maintenance and commercial airline maintenance. We should take advantage of the experience and technological innovations of industry and use them to make our configuration policy, and our entire maintenance effort, more effective for the users in the fleet.

ACKNOWLEDGMENT

The author would like to acknowledge the support from Mr. John Simmons of SABRE Decision Technologies. His willingness to provide data, answer questions and provide briefings to the students and faculty at the Naval Postgraduate School were truly noteworthy. Without his willingness to share commercial information, this research could not have been completed. Additionally, the author greatly appreciated the support from Dr. Nancy Lillo, also from SABRE Decision Technologies. By providing answers to preliminary questions, she gave the author a glimpse of the potential benefits of using a configuration management system in the Navy. The author would like to thank all of the contributors from industry and the government who provided data for this study. I have acknowledged their contributions in the references.

Specific acknowledgment is warranted for Captain Joe Dyer and Commander Jeff Wieringa of the F/A-18 Program for giving me the idea to look at what commercial industry had to offer the Navy in terms of configuration management support. They started the project with their idea. I hope the recommendations from this study will help to better support their program and the fleet in the future.

Also, the author would like to thank Rear Admiral Donald Eaton, USN (Retired) and Dr. William J. Haga for their insight and guidance during this study. Their combined experience in aviation maintenance and information technology respectively, was crucial to the generation of a thesis that was responsible and practical.

Finally, the author would like to thank his wife, Elizabeth H. White, for her patience and understanding during this project. It made it all worthwhile.

I. INTRODUCTION

A. BACKGROUND

As aviation technology becomes more complex, the Navy must find new ways to meet the challenge of controlling the many different operating configurations of aircraft, avionics systems and maintenance support equipment found in the fleet. For example, in the F/A-18 A/B/C/D aircraft, there are 21 production lots of aircraft. [Ref. 1] By definition, every production lot of F/A-18 aircraft will have a different configuration. Added to this problem is the fact that there are concurrent upgrades to the avionics systems and computer software while the aircraft are in production and after they have been purchased by the government. Therefore, in the case of the F/A-18, every production aircraft may have a slightly different configuration depending on which lot it was produced in and the changes/modifications that have been incorporated into that particular aircraft.

The Navy's Aviation System Configuration Management Policy is governed by the Naval Air Systems Command (NAVAIR) Instruction 4130.1C. By NAVAIR's definition,

Configuration management is the discipline involving technical and administrative direction and surveillance for:

- a. Identifying and documenting the functional and physical characteristics of a configuration item.
 - b. Auditing configuration items and their related documentation to verify conformance to specifications, interface control documents ...(compatibility requirements)..., and other contractual requirements.
 - c. Controlling changes to configuration items and their related documentation.
 - d. Recording and reporting information which is essential for managing configuration items effectively, including the status of all proposed and approved changes.
- [Ref. 2: p. 2]

A configuration item is any “aggregation of hardware/software, or any of its discrete components, which satisfies an end use function and is designated by the Government for configuration management.” [Ref. 2:p. A-1] The current configuration item change process requires that all proposed changes, known as Engineering Change Proposals (ECP), Rapid Action Minor Engineering Changes (RAMEC), or requests for major/critical deviation and waivers affecting configuration items be submitted to the NAVAIR Change Control Board (CCB) for approval.

At times, ECPs involve critical safety of flight issues and can be hand carried to the chairmen and the four voting members of the CCB for authorization and approval. [Ref. 2:p. 6-7,8] However, the normal procedure requires the proposed changes to pass through a ten step process that includes staffing the change through, at a minimum, seven different competencies and the program office before a decision is made to forward the proposal to the CCB. If the proposal is forwarded, it is assembled into a package that for a Class I ECP, as defined by MIL-STD-480B, can contain up to twelve separate forms. The proposed change then goes before the CCB for final approval. [Ref. 2:p. 6-7] Once the proposed change is approved by the CCB, the ECP becomes a directive from COMNAVAIR to the office of primary responsibility (usually the Program Office), all affected NAVAIR codes and the fleet. [Ref. 2:p. 6-9]

As would be expected, any change to an aviation configuration item has the potential to affect the designed performance of the system. This could lead to disastrous consequences in the demanding flight environment of Naval Aviation. For this reason, the ECP process is subject to close scrutiny by the chairman and voting members of the Change Control Board.

Membership on the NAVAIR Change Control Board will consist of experienced, qualified representatives from configuration management, systems engineering, production management, logistics support, contracts, aviation training, and other areas as may be required. [Ref. 2:p. 5-8]

The process requires extensive coordination between the program office and the competencies of the voting members and support staffs at NAVAIR that were described above. Under the current process, the average ECP takes 128 days to be approved. [Ref. 3] After approval, there is still a high level of coordination required to make the approved changes in the fleet and document the new change to the previous configuration. According to Captain Steve Heilman, Director of Naval Aviation Maintenance Programs and Policy, “current estimates suggest that it takes an average of twelve years for an approved Depot-level TDC mod kit to be installed in every target BuNo”(aircraft). [Ref. 4:p. 2] Clearly, there is still much work to be done even after the change is approved. Additionally, until every system affected by the change has been modified, there will be systems in the fleet that have different configurations.

Once the change has been approved, the Program Manager (PM), or in some cases the contractor, is responsible to develop the configuration management plan which will define the configuration item and procedures for configuration management application, tailoring, tasks, participants and their roles. [Ref. 2:p. 2-1] In short, the PM must develop the plan and manage the implementation of the change throughout the life cycle of the configuration item.

Managing the administrative processing and actual incorporation of ECPs presents a challenge to Naval Aviation. The Naval Aviation Logistics Command Information System (NALCOMIS) was developed to assist in this effort but according to a representative from the

F/A-18 Program Office [Ref. 5] and a fleet representative [Ref. 6], configuration management problems persist. These problems will be discussed in detail in Chapter III.

However, we are not alone. The commercial airline industry is faced with the same problems. According to Heizer and Render (1996), “For a complex product that has a long manufacturing cycle, such as a Boeing 747 jumbo jet, the changes may be so numerous that no two 747s are built exactly alike – which is indeed the case. [Ref. 7:p. 228]

Several commercial airlines including American, Northwest, Canadian, and Cathay Pacific use an information technology (IT) product developed by SABRE Decision Technologies to control their aircraft configurations and maintenance records. It may be possible for the Navy to use a similar system to manage our configuration control process.

B. METHODOLOGY

Data have been gathered for this study from current Navy instructions, Navy maintenance manuals, newspaper and magazine articles, textbooks, and classroom lectures. Additionally, the F/A-18 Program Office has provided data on the ECP process and problems associated with implementing ECPs, the draft requirements document that describes requirements for a proposed Automated Maintenance Environment (AME), and various instructions and memos regarding configuration management. A representative from Commander, Naval Air Force, Pacific Fleet (COMNAVAIRPAC) has provided more data on current issues and problems with configuration management and other data has been gathered from searches conducted on the worldwide web

Also, personnel from the SABRE Decision Technologies have assisted me with the collection of various forms of data concerning their configuration management system, its’

operation, and benefits and costs of using IT to perform configuration management. Additionally, they provided answers to my specific questions via telephone or e-mail. SABRE also visited with the students and faculty at the Naval Postgraduate School on 6 February, 1997 to discuss the capabilities of the CM system.

Finally, a representative from the RAND National Defense Research Institute made data available on Electronic Data Interchange (EDI) and discussed process re-engineering as it relates to organizations plans to adopt any new IT system to manage complex processes.

The data will be used to define the Navy's Configuration Management process, identify problems with the current process and identify requirements for future configuration management systems. For this study, I have identified an information system developed by SABRE Decision Technologies for Aircraft Configuration Management. The system is used by the commercial airlines to maintain their aircraft configuration control.

I intend to study SABRE's Configuration Management system and make recommendations regarding its' utility to the Navy for managing our configuration control policy.

II. NAVY CONFIGURATION MANAGEMENT

A. CURRENT PROCESS

The Navy's current configuration management policy is a top level process managed by the NAVAIRSYSCOM. NAVAIR sets the policy, governs the operation of all Change Control Boards (CCBs), and approves/disapproves all configuration management plans. [Ref. 2:p. 2-3] Additionally, NAVAIR delegates authority to the Office of Primary Responsibility, usually the Program Offices, to provide configuration management of assigned configuration items throughout their life cycle. [Ref. 2:p. 2]

The change approval process at NAVAIR is a 10 step process generally depicted in Figure 1. From the figure, it can be seen that the NAVAIR change process has five distinct phases. They are:

1. Proposed Change Receipt and Evaluation
2. Proposed Change Coordination & Formal Staffing
3. CCB Preparation, Approval & Direction
4. Implementation of Approved Change
5. Change Status

There are 10 steps in the change process that govern the processing of all changes brought before NAVAIR for approval.

STEP 1: The first step occurs when a change to a configuration item, proposed by a contractor or government agency, is delivered to AIR-1006. The proposed change processing

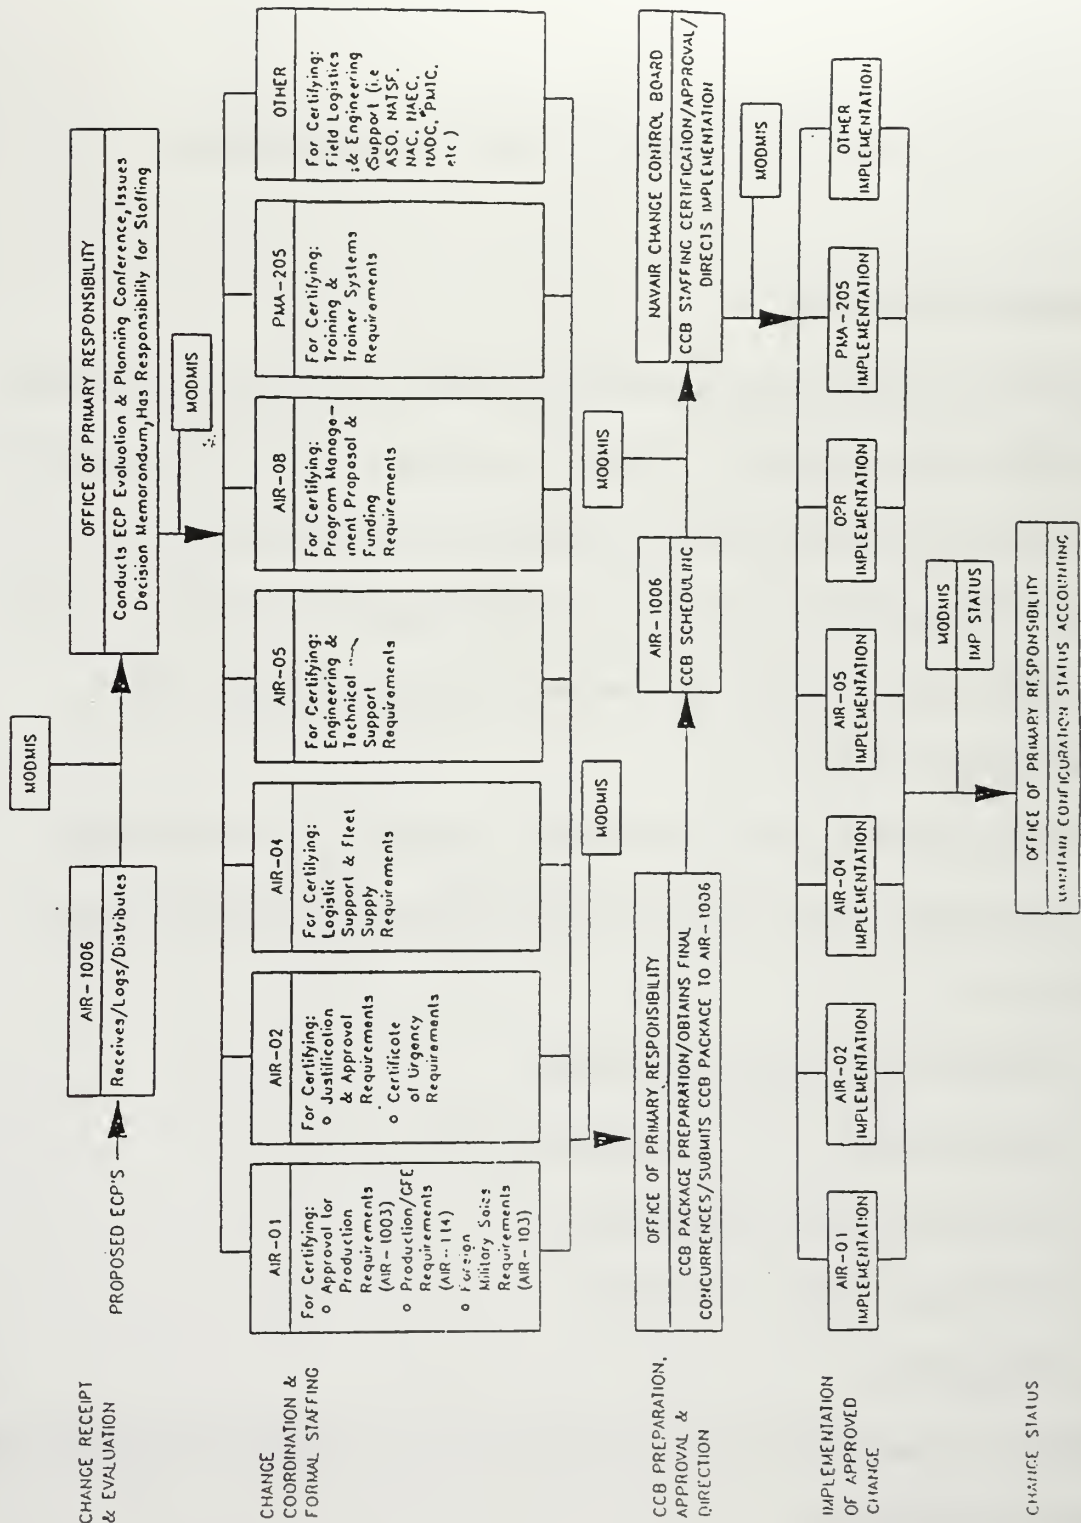

Figure 1. ECP Process at NAVAIRSYSCOM From Ref. [2].

information is entered in the Modification Management Information System (MODMIS) where the proposed change is assigned a tracking number that is used to determine status.

[Ref. 2: p. 6-1]

STEP 2: After the proposed change is logged into the MODMIS tracking system, it is forwarded to the Office of Primary Responsibility for action.

STEP 3: The Office of Primary Responsibility has responsibility for staffing the proposed change through all appropriate competencies. Then the Office of Primary Responsibility conducts an ECP Evaluation and Planning Conference and makes the decision on whether or not to proceed with the proposed change. The Evaluation and Planning Conference will include, as a minimum, representatives from the following functional areas; AIR-02(Contracts), AIR-04(Logistics), AIR-05 (Engineering), AIR-1003(Automated Systems Analysis), AIR-114(Production Management), and PMA-205(Aviation Training Systems Program Office). Others may attend if required. [Ref. 2:p. 6-2]

STEP 4: Once the decision is made to process the proposed change, the Office of Primary Responsibility issues a Decision Memorandum to AIR-1006, AIR-02, AIR-1003, AIR-08P(Budget), AIR-04, AIR-05, PMA-205 and all other concerned parties. A sample Decision Memorandum is contained in Appendix A. Copies of the proposed ECP will be forwarded with the Decision Memorandum. [Ref. 2:p. 6-3]

STEP 5: The Office of Primary Responsibility prepares the Change Control Board package to be submitted to the NAVAIR CCB via AIR 1006. The contents of this package will vary, depending on the type of change being requested. In the case of an ECP, up to 12 different

forms are required to prepare a complete CCB Change Package. A list of the forms required for the preparation of CCB change packages appears in Appendix B. [Ref. 2:p. 6-3, 6-4]

STEP 6: The NAVAIR competencies identified in STEP 4 provide their inputs to the Office of Primary Responsibility who compiles the inputs and presents the complete package to AIR-1006. [Ref. 2:p. 6-5, 6-6]

STEP 7: AIR-1006 verifies the CCB change package, updates the MODMIS, and schedules the proposed change for a formal CCB hearing. [Ref. 2:p. 6-6]

STEP 8 & 9: The NAVAIR Change Control Board meeting is held and the proposed change is approved/disapproved. [Ref. 2:p. 6-7]

STEP 10: After approval of the change, the Office of Primary Responsibility must notify the change originator and all implementing codes that the proposed change has been approved. Additionally, the Office of Primary Responsibility must ensure that all approved actions are carried out as directed by the CCB and maintain configuration status accounting of the weapons system modification process. [Ref. 2:p. 6-9, 6-10]

B. CHANGE INCORPORATION

Once the change has been approved, it is released to the fleet for incorporation and inclusion in applicable maintenance manuals and/or procedures. The change can be distributed via message or letter, depending on the urgency of the requirement for the change. An example of an Avionics Change (AVC) for the F/A-18 aircraft is contained in appendix C.

Using the F/A-18 AVC as an example, it can be seen that it contains:

1. Cognizant Codes and Points of Contact

2. Category of the Change
3. Documentation Affected
4. Purpose of the Change
5. Application (Affected Equipment/Trainers/Spares)
6. Compliance
7. Man-Hours Required
8. Supply Data
9. Reidentification
10. Detailed Instructions
11. Weight and Balance
12. Records Affected
13. Verified By
14. Rescission Date
15. Related Instructions/Information

An example of a maintenance publications change for the T58-GE-16 engine on the CH-46 is contained in Appendix D.

The F/A-18 message and the CH-46 publication change have similar formats. Both changes require that a Visual Identification System/Maintenance Action Form (VIDS/MAF) be submitted to document compliance with the technical directive. Additionally, the changes require a logbook entry in the technical directives section to document that the change has been incorporated.

C. CONFIGURATION STATUS ACCOUNTING

In addition to documenting changes to configuration items on VIDS/MAFs and updating the technical directive section of the logbook, a report describing the modification must be made to the Technical Directive Status Accounting (TDSA) Program. The TDSA “was developed to gather data on technical directive application and incorporation status as related to aircraft, engines, support equipment, maintenance trainers and serial numbered weapons system components.” It is managed by the Naval Aviation Maintenance Office. [Ref. 2:p. 7-2]

III. CONFIGURATION MANAGEMENT PROBLEMS

A. BACKGROUND

As the technical complexity of new weapons systems increases, Naval Aviation is faced with an increasingly challenging task of managing configuration control. Ultimately, the consequences of failing to maintain accurate configuration control of assets will result in a degraded state of Operational Readiness. Specific examples of the effects on configuration control breakdowns are that:

1. Product documentation no longer reflects the characteristics of the actual products being procured because of unapproved/undocumented changes that were made after the design phase.
2. Logistics support data no longer corresponds to configuration items making it difficult for the fleet to properly maintain and operate the equipment.
3. Products are immobilized while corrected supporting documentation can be published.
4. Increased scrap, rework, and stock result. [Ref. 8:p. 3]

Configuration Management breakdowns also have significant affects on aviation support equipment in the fleet. Commander Mike Hardee, the Maintenance Officer at Commander, Naval Air Force, Pacific Fleet, described an example of a breakdown in configuration control of Automatic Test Equipment (ATE). Hardee (1996) noted that “for aircraft, components and rolling stock, much of the lack of configuration control is attributable to a loss of discipline on the part of engineering, logistics and maintenance personnel relative to the established processes.” He states that “the problem with ATE’s is that there is no formal process to track configuration

control.” Therefore, each ATE custodian must contact the ATE’s Cognizant Field Activity to determine if the ATE has the most current documentation/software. [Ref. 6:p. 1]

Finally, Hardee (1996) believes that the larger problem with our management of configuration control is that the Navy has demonstrated “...a failure to get information to user activities in a manner that is: timely (so that it stays abreast of configuration updates), comprehensive and accurate (so that it precludes maintenance malpractice) and controlled (so that it can be inventoried and accounted for).” The Navy’s determination to provide the fleet with the most up to date equipment has overcome our ability to provide the necessary logistic support. These problems have caused disruptions in the logistics pipelines and have, in some cases, jeopardized the safety of personnel in the fleet. [Ref. 6:p.1]

The previous paragraphs give general examples of problems with configuration management. It can be seen that failure to maintain configuration control at the Systems Command level and in the fleet can result in serious consequences. Here are two specific examples where a breakdown in configuration management resulted in potentially life threatening situations.

B. AV-8B HARRIER EJECTION SEAT FIRING CONTROL HANDLE

On 1 March 1991, Aircrew Systems Change (ACC) No. 537 was issued for the T/AV-8B aircraft. The purpose of this change was to change the shape and the flexibility of the lower ejection handle for the ejection seat in the aircraft. A hazard had been identified where it was possible for the ejection control handle to become entangled with the control stick when the seat was in the full upright position. ACC 537 would eliminate the possibility of an inadvertent

ejection caused by interference with the control stick by reducing the circumference of the ejection control handle and making the ejection control handle material less flexible. [Ref. 9:p. 2]

This change should have corrected the hazard that was identified by the operators in the fleet. However, a breakdown in the configuration management process occurred which allowed the original handle to remain in the aircraft. In this case, the problem was not identified until 1996. Although the part numbers of the firing control handles were different, the National Stock Number (NSN) remained the same. Squadrons that thought they had complied with the ACC 537 may have been flying aircraft with the old firing control handle instead of the new one. Fortunately, this problem was identified by an alert maintenance technician who promptly informed his chain of command. A hazardous material report was released and the Systems Command and Type Commanders were notified of the problem. [Ref. 10]

Once the Naval Air Systems Command was informed of the problem, they developed a method to ensure that the handles were removed from the aircraft and purged from the supply system. The fleet was required to physically inspect every seat to verify that the correct handle had been installed. If the correct handle had not been installed, the fleet was directed to make the correct change to the seat using the redesigned handle. Additionally, the supply system was directed to screen all NSNs in the system and eliminate all of the original firing control handles. [Ref. 11]

After a complete physical inspection of the aircraft, 15 original handles were discovered. [Ref. 10] [Ref. 12] This action was completed five years after ACC 537 was originally issued.

C. F/A-18 POWER SUPPLY FOR AIR DATA COMPUTER

On 27 April 1993, Avionics Change (AVC) No. 4399 was released to provide instructions to F/A-18 Organizational (O-level) and Intermediate (I-level) maintenance activities to correct a problem with the Air Data Computer (ADC) in the aircraft. This change was designed “to reduce ADC power supply circuit noise that may induce aircraft to pitch up/down.” [Ref. 13:p.1]

This change required O-level maintenance to remove the ADC from the aircraft for return it to I-level maintenance where it would be changed. The change would eliminate power transients that were thought to be causing the aircraft to pitch up/down when certain modes of the autopilot were being used. This potential for aircraft pitch up/down resulted in the following flight restrictions for all Lot XIII and below aircraft:

Do not engage barometric altitude hold feature when:

1. Flying below 5000 ft
2. IMC flight
3. Formation flight [Ref. 14]

However, AVC 4399 contained erroneous maintenance procedures that were discovered after the change was issued. In order to correct discrepancies found in the original change, Interim Avionics Change (IAVC) No. 4242, Revision A was issued on 27 April 1993. IAVC 4242 corrected the erroneous procedures found in AVC 4399 and added a ferrite bead to the ADC power supply to contain noise that was generated by the electronics in the system. This bulletin was to be completed not later than 60 days after receipt of the directive. [Ref. 15]

Unfortunately, the problem with locating, identifying and modifying ADCs continued. On 6 July 1995, Avionics Bulletin (AVB) 512, Revision A was issued to “ensure correct installation of ferrite bead noise suppresser in ADC power supplies.” [Ref. 16:p. 1] In August and September of 1995, Commander, Naval Air Force, Atlantic and Commander, Naval Air Force,

Pacific required their units to conduct physical inventories of all ADC assets to ensure that they had been updated in accordance with the bulletins. [Ref. 17:p.1] [Ref. 18:p.1] These procedures were initiated because the Type Commanders had concerns that “100 percent compliance had not been accomplished to date.” [Ref. 19]

On 16 January 1996, AVB 512 was canceled by the Naval Aviation Depot at North Island. [Ref. 20] It was replaced with Avionics Bulletin (AVB) 561 on 18 January 1996. AVB 561 was issued “to ensure that all P/N 4031000-902 ADC power supplies have been replaced with P/N 4031003-915 power supplies.” [Ref. 21:p. 1]

This is clearly an example of a breakdown in management’s control over incorporation of a change to the ADC. In this case, management’s lack of total asset visibility required multiple physical inspections to ascertain where the assets were located and to ensure that the required changes had been incorporated. Furthermore an additional requirement for the fleet to provide monthly reports were generated to track assets and verify change incorporation. [Ref. 17] [Ref. 18] According to the bulletins, the total time required for avionics technicians to complete the actions described in each of the above technical directives was approximately 13 hours (O and I-level labor) per computer. This does not include administrative time to check/update logs and records. In addition to the man hours required to complete these actions, all Lot XIII and below F/A-18 aircraft remained under the flight restrictions in effect from [Ref. 14]. Those flight restrictions have been in effect for three years.

D. SUMMARY

The previous situations are glimpses at the potential ramifications of breakdowns in the configuration management process. These are only two examples of problems that are being faced every day in the fleet. In both cases, it was necessary for the fleet to conduct physical inventories of all affected components to positively verify that the correct changes had been incorporated. We have placed the burden on the users in the fleet to compensate for our inability to manage configuration control. The time and effort expended by maintenance and support personnel to solve problems such as these is detracting from their ability to focus on other mission critical areas and detracting from the overall maintenance effort on our aircraft. There must be a better way to manage this process.

In the next chapter, I will look at a commercial information technology (IT) system that is used by the airline industry for managing the configuration control process.

IV. SABRE DECISION TECHNOLOGIES (SDT) CONFIGURATION MANAGEMENT SYSTEM

A. BACKGROUND

In 1991, American Airlines Decision Technologies (AADT) developed computerized decision support tools to plan maintenance tasks and calculate the optimal number and location of spare parts. [Ref. 22] In their first year of operation, the maintenance planning system and the inventory control system saved American Airlines over \$15 million. Saving money was not the only benefit from creating these systems. There was a reduction in the time required to plan and analyze alternatives. Mark Tedone, a director of the development effort, described the effect of the time savings on the organization at American Airlines.

In addition to the fact that you can now generate a plan for our entire fleet in half an hour or less, as opposed to taking two or three weeks in the past, you can use that spare time to look at alternatives. It gave the analyst time to say: ‘What can I do to make better use of what we have’. It essentially turned the analyst, who in the past was a number cruncher, into a real analyst. [Ref. 22]

The effectiveness of using information technology (IT) to assist with the maintenance and engineering efforts of the commercial airlines created demand for a single integrated product to manage the entire maintenance effort.

In 1995, AADT became SABRE Decision Technologies, a Division of the SABRE Group, Inc. They developed the EMTECH system which was designed to be a “state-of-the-art maintenance and engineering system.” [Ref. 23] According to the manufacturer, the system was designed to:

1. Increase efficiency and productivity in all major functional areas.
2. Provide an accurate tracking system.
3. Improve management effectiveness.
4. Streamline the business process.

5. Facilitate customization for any size airline and repair station through modular design features. [Ref. 23]

EMTECH is composed of four separate application modules as shown in Figure 2.

Figure 2. EMTECH Application Modules From Ref. [23]

This grouping of application modules is “aimed at providing the client complete automation in all mainstream activities, and assures the connectivity of information among functional areas.” [Ref. 23:p. 2] Each module is broken up into various sub-modules as determined by functionality. For this study, my focus will be on the Configuration Management Module. This module is part of the EMTECH Maintenance Module that is displayed in Figure 3.

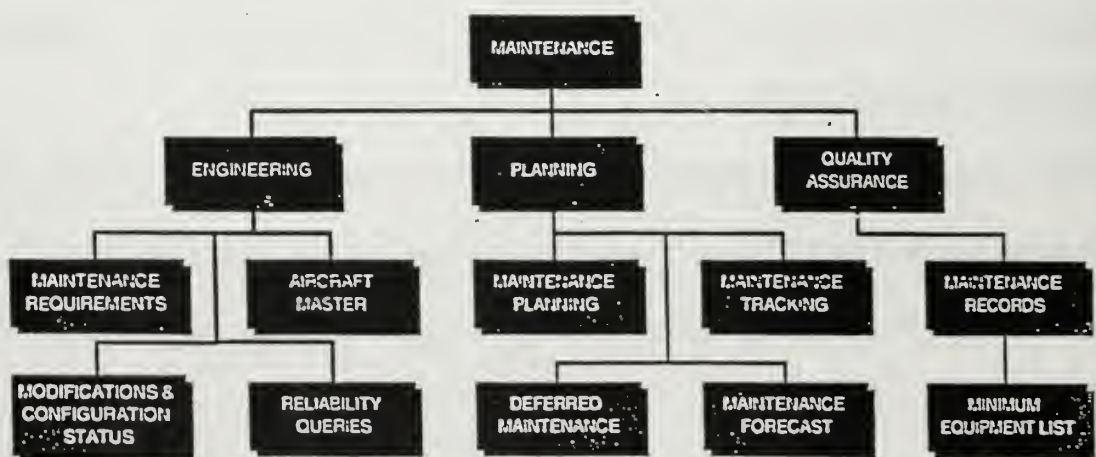

Figure 3. EMTECH Maintenance Module From Ref. [23]

Figure 3 shows the Configuration Management Module as it is integrated into the EMTECH system. While it was designed to work with an EMTECH core data base, the Configuration Management Module can be utilized as a stand-alone system with an existing maintenance data base. [Ref. 23:p. 10]

B. SDT CONFIGURATION MANAGEMENT MODULE

The commercial airline industry has recognized that management of configuration control is critical for the safe operation of aircraft. Additionally, failing to accurately manage aircraft and component configurations can result in inefficient asset allocation and increased maintenance costs. According to SDT,

Ensuring correct aircraft configuration and service records of critical aircraft components are two of the difficult and time consuming tasks necessary for safe operation. Failing to perform these assignments can shorten the life of expensive components and increase aircraft downtime. [Ref. 24:p. 1]

SDT's answer to configuration management was an electronic decision support tool that would manage the complexity of maintaining configuration control while using the benefits of computer technology to allow managers to quickly and accurately monitor status of critical parts and create tailored reports for specific items of interest.

SDT's Configuration Management Module "runs in a client-server environment using a UNIX file server, Oracle relational database management system, and a Windows-based PC workstation." [Ref. 24] The graphic user interface (GUI) looks similar to other Windows applications. It uses a mouse driven interface with pull-down menus, pop-up dialog boxes, and fast keys. [Ref. 24] An example of the Configuration Management display showing an assembly parts screen that is used for configuration management is displayed in Figure 4.

The screenshot displays the 'Assembly Logical Build' screen with the following sections:

- Assembly Logical Build:** A table with columns for BN, MFG S/N, and other assembly levels. It includes a 'Find Any Part' button and a 'Find UA Part' button.
- Current Component Info:** A section for detailed component information, including fields for BN, MFG S/N, RSPAM HR, MFG Part NR, Own, AAID, and a 'Calc Current' button.
- Attached Service Bulletins:** A section for service bulletins, including fields for SB Numbers, Accm Ctl, and Accm Date.
- Unattached Parts:** A section for unattached parts, including fields for BN, MFG S/N, and other part details.

Buttons at the bottom include 'Create Part', 'Detach Part', 'EXIT', 'Delete Part', 'M/A Adjust', 'SAVE', 'Scrap Part', 'E-Change', 'On Wing', 'UA Part Info', and 'Attach Part'.

Figure 4. SDT Assembly Parts Screen From Ref. [25]

The assembly parts screen has four sub-sections that are used for configuration management. Starting from the top of the display, they are; the assembly logical build section, the current component information section, the attached service bulletin section and the unattached parts section.

1. Assembly Logical Build Section

The assembly logical build section, located at the top of the assembly parts screen display, is used to display configuration items by serial number from the assembly level to the individual

piece parts that make up that particular assembly. An example of a assembly logical build section for a jet engine is contained in Figure 5.

Assembly Logical Build								Version D.9.50	
Assembly		Modules		Sub-Assemblies		Piece Parts			
IN	MFG SN	IN	MFG SN	IN	MFG SN	IN	MFG SN		
000	709918	98C	K9918C	200	K9918N1	150	BLA1918		
		98E	K9918E	300	K9918CS	201	KK1200		
		98G	K9918G	666	K09918	201	KK3135		
		98H	K9918H	750	K9918LT	201	KK3559		
Usq Cd Displayed									
ALL PARTS		4		5		38			

Figure 5. SDT Assembly Logical Build From Ref. [25]

In Figure 5, an engine assembly with serial number 709918 has been selected for viewing. The display shows that this particular assembly contains four modules. In this case, since none of the four modules have been highlighted, the system defaults to display the sub-assemblies for the top module with manufacturer’s serial number K9918C. Therefore, we can see that module K9918C has five sub-assemblies. Once again, the system defaults to display the piece parts of the top sub-assembly if no other sub-assemblies have been highlighted. In this case, there are thirty-eight piece-parts associated with sub-assembly number K9918N1.

The maximum number of modules, sub-assemblies, and piece parts that can be displayed at one time is four. However, the operator is cued to the fact that there are more modules, sub-assemblies or piece parts to be viewed by the numbers (when greater than four) at the bottom of each column and the checkerboard pattern in the scroll boxes to the left of the columns.

[Ref. 25:p. 4]

2. Current Component Info Section

The center section of the assembly parts screen contains current component information.

This information is broken up into two parts. The first part of the display contains information that was current on the selected part at the time the part was installed. This section is displayed in Figure 6.

IIH	MFG S/N	RSPAM NR	MFG Part NR	Own	AAID	Aty Cd	ON_AC	2
701	M53643	DISX256	5004301-01 ND	AA		Usg Cd	LLP	1
NHA	NHA MFG S/N	Base ENG S/N	TY EQ					
700	K9918HT	709918	17 *					
<u>A/C at Installation</u>		<u>Part Allowable Lmts</u>						
Tail / Pos	259 2	Hours	90000					
Hours	28471	Cycles	20000					
Cycles	16770	Date						
				<u>Part Date Info</u>		<u>Adj Time</u>		
				Install	07/27/94	Hrs	0	
				Review	05/04/92	Cyc	0	

Figure 6. SDT Current Component Info From Ref. [25]

In this example, it can be seen that the highlighted part with manufacturer's serial number M53643 is installed on base engine number 709918 in position 2 on an aircraft with tail number 259. At the time the part was installed, it had 67,207 hours and 6,337 cycles remaining in its' service life. [Ref. 25:p. 6]

The second part of the current component information section displays information on the selected part that is valid for the time that is entered in the effective date portion of the display.

This section is displayed in Figure 7.

<input checked="" type="checkbox"/> Auto Calc Info		Calc Current	
Effective Date		05/02/95	
	Total Part	Since Repair	Time Remain
HOURS	25099	8248	81752
CYCLES	14813	4592	15408
AVG Hours	AVG Cycles	EST Days	EST Date
8.27	4.16	3700	06/18/05

Figure 7. SDT Current Component Info From Ref. [25]

In this example, as of 05/02/95, there are 81,752 hours and 15,408 cycles remaining on the selected part. Additionally, using actual operations data from the central database, the system calculates the average usage of the part and uses that information to forecast the estimated date for expiration of service life. In this case, the part averages 8.27 hours and 4.16 cycles per day. Based on that usage, the part will last for another 3,700 days. Its' estimated expiration of service life at those rates will be on 06/18/95. [Ref. 25:p. 6]

3. Attached Service Bulletin Section

The attached service bulletin section of the configuration management system contains pertinent information on open and closed service bulletins for the selected part. All service bulletins (open and closed) that pertain to the selected part are automatically displayed. An example of the Attached Service Bulletins section is contained in Figure 8.

In this example, there are twenty-five service bulletins associated with the selected part. This section displays the service bulletin number, the accomplishment code (how/when the service bulletin should be accomplished), and the date that the service bulletin was accomplished. If more information on the service bulletin is desired, the operator can select the Run SB box on the lower

Attached Service Bulletins

Figure 9. SDT Service Bulletin Screen From Ref. [26]

The service bulletin screen gives the operator an in-depth look at the service bulletins that were displayed in the Attached Service Bulletins section on the assembly parts screen.

Additionally, the operator can view other service bulletins, edit service bulletins, query parts associated with service bulletins and detach parts, as desired. [Ref. 26:p. 3-13]

The system will allow the operator to change virtually everything about the desired service bulletin except four critical fields. These four fields are the Industry Identification Number (IIN), the Type Equipment (Type Eq) code, the service bulletin number, and the accomplishment code (ACM CD). These fields can only be created or altered by a central database manager. This function protects the system from corruption by inadvertent operator errors. [Ref. 26:p.4] Figure 10 displays a warning that would be displayed to the operator if he/she tried to enter a service bulletin number of an already existing service bulletin.

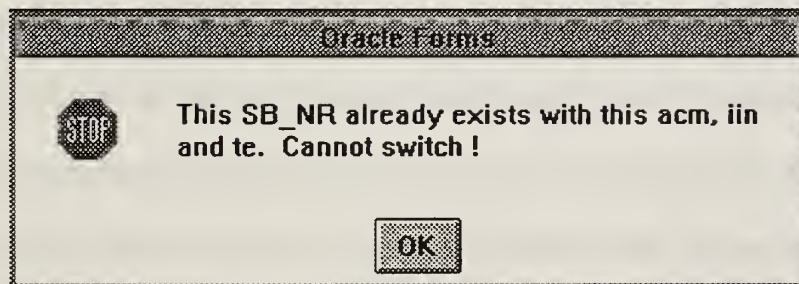

Figure 10. SDT Service Bulletin Conflict Warning From Ref. [26]

4. Unattached Parts Section

When changes are made to configuration items, the unattached parts section is used to update the current configuration. The unattached parts section is displayed in Figure 11.

Unattached Parts				
	UH	MFG S/N	UHA	UHA MFG S/N

+	407	6A8565	400	
UA Part Info			Attach Part	

Figure 11. SDT Unattached Parts Section From Ref. [25]

Using the unattached parts section, the operator highlights the part that he/she wants to attach to a configuration item. Then the assembly that will be modified is selected and the part is moved to its' new position. Once the action is saved, the configuration is instantaneously updated. [Ref. 25:p. 12]

C. BENEFITS

The commercial airline industry uses this system to maintain accurate aircraft configuration and maintenance records. It provides an accurate tracking tool for all parts and allows planners to quickly and accurately forecast part service life and estimate dates for critical component service requirements. Additionally, the system tracks current information on service bulletins, engineering change orders and airworthiness directives. [Ref. 24:p. 1]

Another benefit of the system is that it allows the operator to quickly retrieve and sort data to verify configurations, forecast maintenance requirements, and determine what maintenance tasks have been accomplished. Users can generate regular reports to allow maintenance managers to monitor configuration control status, make plans for regular service, and monitor life history of configuration items throughout their life cycle. [Ref. 24:p. 1-2]

The system protects operators from inadvertently entering data incorrectly. This is accomplished through the use of alerts to notify the operator of “illegal configurations, invalid data entries, or significant changes to part age information (measured in hours, cycles, and days).” [Ref. 24:p.2] Additionally, by using a central database, the system eliminates the potential for data discrepancies by eliminating redundant data that exists in organizations that maintain separate databases. This function reduces the problems associated with simple mistakes in documentation that can lead to a loss of configuration control. [Ref. 24:p. 2]

Finally, SDT’s Configuration Management system has a standard Windows graphic user interface which operators are likely to be familiar with. It allows operators to quickly update the database and complete transactions with the standard menus and point-and-click functions found on other Windows software products. [Ref. 24:p. 2]

The next chapter will describe how the SDT Configuration Management System could have prevented the problems with Navy Configuration Control that were discussed in Chapter III.

V. BENEFITS OF SABRE DECISION TECHNOLOGIES (SDT) CONFIGURATION MANAGEMENT SYSTEM

A. GENERAL

The commercial airline industry uses information technology to manage many critical aspects of aircraft maintenance, including incorporation and tracking of configuration changes to their aircraft. Driven by a strong profit motive and desire to reduce costs while increasing capacity, the industry has seen the benefits of using a computer system to maintain configuration control.

At this point in my study, I wanted to present a cost benefit analysis to illustrate the potential cost savings and benefits to be realized through the use of a configuration management system. I asked two members of the SDT group to help me obtain data that had been used to convince the top level decision makers in industry to accept the relatively high costs of implementing a computer network to manage an entire commercial airlines maintenance effort.

Interestingly, there was never a formal cost benefit analysis or post-implementation review. The benefits were so obvious to the maintenance personnel and top level managers that the system basically sold itself outright. In fact, according to one of the engineers at SDT, "...this was a quantum leap...the issue from the start was 'can it be done' rather than 'should it be done'. [Ref. 27:p. 2]

In general, while there has been no formal report of the benefits of using decision support systems, there are some informal measures of effectiveness that have been observed. The largest impact of implementing the configuration management system has been in the allocation and distribution of materials. The configuration management system has given maintenance planners

the capability to forecast upcoming requirements for assets and ensure that the proper materials are available to maintenance technicians at the proper time. Total asset visibility (TAV) is a competitive advantage for industry because they can use TAV to reduce total inventory of material by accurately forecasting requirements and ensuring that only the necessary parts are ordered to make the required configuration changes. Because the system allows the users to forecast the exact requirements for parts, there is no need to create excess inventories to guard against unexpected demand. If there is no unexpected demand for parts, the costs associated with holding excess inventory for “unexpected demand insurance” can be eliminated. [Ref. 28]

Another benefit of implementing the configuration management system has been in the area of time savings. In one example, a 30 year old system that used overnight batch processing was replaced with the real time system, developed by SDT, using a graphic user interface. When the clerks saw that they could input data faster and more reliably, they were impressed. However, in addition to reducing the time required to perform data entry and editing, the clerks found that they could also reconcile differences in data much more quickly with a real-time system rather than having to wait for the next days audit report from the old system. According to Lillo, “Maintenance is taken seriously at American Airlines and it was clear this system would help the clerks do their job better.” [Ref. 27:p. 2]

Another example of time savings has been realized at the commercial depots where the time to update records for aircraft coming out of depot level maintenance has been reduced from 10-18 days to a maximum of two days. [Ref. 28]

The airlines saw the potential to increase their efficiency and effectiveness in managing the complex requirements of aviation maintenance by using information technology to their

advantage. In the following examples, I will discuss how the use of a configuration management system could have prevented the Navy's problems with configuration control that I identified in chapter III.

B. SPECIFIC

In this study, I have identified two specific examples of breakdowns in configuration control. In both cases, the fleet was required to conduct a physical inventory of all configuration items in question to positively identify their current configuration. This "last ditch" method to maintain configuration control could have been avoided if the SDT Configuration Management system had been in place. In the examples that follow, I will show how SDT's system could have prevented the specific examples of configuration management breakdowns on the AV-8 Harrier and the F/A-18 Hornet.

1. AV-8 Harrier Ejection Seat Firing Control Handle

The ejection seat firing control handle for the AV-8 was re-designed to protect aircrews from the possibility of inadvertently ejecting from the aircraft when the pilot's control stick became entangled with the Ejection Seat Firing Control Handle. Unfortunately, both the old and new ejection seat firing control handles were given the same National Stock Number (NSN). This created a situation where old handles were still in inventory, and in 15 instances, still found installed in operational aircraft. [Ref. 10] [Ref. 12]

The problem and the ensuing requirement for a physical inventory to verify current configurations could have been avoided by using SDT's Configuration Management system. Although the ejection seat firing control handles had the same NSN, they had different part

numbers. The SDT system would have alerted the operator that a potential problem existed because the database will not accept two different part numbers with the same NSN that are not interchangeable. This alert would have given a “heads up” to the operators and the logistic support pipeline personnel that the old handles needed to be purged from the system and/or the new handles needed an new NSN. Regardless of those facts, the new service bulletin (ACC in this case) could only have been accomplished by installing the correct ejection seat firing control handle with the new part number. [Ref. 29]

With the SDT system, even if the initial conflict had not been identified, there would never have been a requirement to conduct a physical inventory to positively determine the configuration of the fleet’s ejection seats. Using SDT’s Configuration Management system, an exception report could have created that would scan the current configuration status of all ejection seats and print out a list of the seats that had not received the modified ejection seat firing control handles. Once the assets that had not been modified were identified, the correct handles could have been sent to the squadrons who had aircraft that needed to be retrofit. [Ref. 29]

2. F/A-18 Power Supply for Air Data Computer (ADC)

In this example, configuration control was lost because of a lack of asset visibility. Many of the power supplies had been modified in accordance with an AVC and then corrected with an IAVC. However, the problem was that without physically checking the ADCs, the operators in the fleet and the logistics support personnel could not positively determine which boxes had received the proper “fix”. In this example, a Configuration Management system could have been used to track the status of updates to the computers. The configurations of the ADCs on the aircraft and in the shops would be in the database. Each computer could be identified by its serial number. Additionally, the sub-assemblies and in some cases, the piece parts could be positively

identified. As described in the first example, by running an exception report, the ADCs that had not been modified correctly could be identified, modified, and returned to service.

VI. CONCLUSIONS AND RECOMMENDATIONS

A. CONCLUSIONS

I conclude that there are two fundamental challenges that confront the current Naval Aviation Configuration Management Policy: **(1) the process used to review and approve Engineering Change Proposals (ECPs) and (2) the management and control of the configuration changes once they are approved and released to the fleet for incorporation.**

1. ECP Review and Approval Process

The process is too complex and has too many stakeholders that must be satisfied independently.

For example, for a Class I ECP, there are up to twelve different forms that must be completed and staffed through at least seven NAVAIR staffs for their concurrence. These staffs route the ECP through their organizations and take input from the Type Commander. Once the staffs have acknowledged their concurrence with the proposed ECP, the entire package is collected by the program manager and submitted to the Configuration Change Control Board (CCB) for final approval. The average time to complete this process, from ECP proposal to approval, is 128 days. [Ref. 3]

This process is similar, on a smaller scale, to a challenge that the nation of Singapore was facing when it resolved to control the entire nations import/export industry by using Electronic Data Interchange (EDI). In 1987, Singapore's trade governing agencies were executing about 10,000 transactions per day. Each transaction required at least four documents to be completed. In some cases, as many as twenty forms were required to complete a transaction. All

documentation was hand carried by courier and the average turnaround time for each transaction was two days. “Swedish and U.S. studies of the costs of trade documentation in those countries estimated that the cost at 4% to 7% of the value of goods shipped.” [Ref. 30:p.192]

Singapore created a joint government/commercial trade information system called TradeNet. They took all of the forms required for import/export transactions and consolidated them into one form. Not only did they consolidate the forms required to approve import/export transactions, they created a new process, supported by an EDI system, that was capable of accepting and approving a transaction in less than 10 minutes. [Ref. 30:p. 203] If an entire country can work together to create an electronic system that can approve and document import/export transactions on one electronic form, we should be able to consolidate our ten different ECP staffing/concurrence forms into one electronic form and distribute it electronically through our organization, in parallel, for approval.

The current ECP process at NAVAIR is undergoing an internal review as the NAVAIR organization shifts to the new Competency Aligned Organization (CAO) structure. This is a first step in creating a new approach to configuration management policy. We must change the process before we try to adapt new technology to an old process. According to RAND, “if you use EDI only to transfer information electronically, but along the same lines of a previous manual process (paving cowpaths), you may not see any improved responsiveness.” [Ref. 31]

While I applaud NAVAIR’s initiative to re-engineer this process, I am concerned that an internal review of the current process by the people who manage configuration policy on a daily basis will only result in recommendations for incremental changes to the existing policy. The people who have been charged with this review have been placed in an unenviable position. They

have been asked to determine if the jobs that they perform on a day to day basis are required. It is difficult enough to be objective when other people's jobs are at stake, but almost completely impossible for any one to eliminate their own position. Furthermore, by asking them to perform this study, we are reducing their effectiveness at performing their primary responsibilities by placing new demands on their time to complete this study. We must find a neutral third party to study the current process, interview the customers in the fleet and the program managers who support them to find out what is really needed, and make recommendations to create fundamental changes to support configuration management policy to guide us into the twenty-first century.

2. Configuration Change Management

Our method of managing configuration changes is man-hour intensive and has potential for human error with every report that is transmitted through the chain of command. It is a tribute to the dedication and hard work of the men and women at NAVAIR and in the fleet who make the system work on a daily basis.

Once the CCB approves the ECP, the program office is charged with supporting implementation of the change and tracking change incorporation for the rest of the configuration items life cycle. For the F/A-18 program office, this involves tracking 568 ECPs contained in approximately ten file cabinets that are located at NAVAIRSYSCOM in Washington, D.C.

[Ref. 32] F/A-18 uses a government contractor to manage configuration control. The fleet makes the changes in accordance with the published ECP and reports incorporation of the change by completing a VIDS/MAF and making the required annotations in the technical directives section of the configuration item log book. This process is man-hour intensive and has potential for operator error with every report that is transmitted through the chain of command. It is truly

remarkable that the logisticians have been able to use the system at all. However, as described in chapter III, when a configuration breakdown occurs, the consequences can be severe. Naval aviation is an inherently dangerous business. Loss of configuration control can, at least require physical inspection of all affected assets to positively ascertain their configuration. At worst, it may lead to a loss of life and/or an inability to perform an assigned mission. As our resources for logistics support continue to shrink, we must find ways to maximize the productivity of our personnel and to minimize the costs associated with maintaining configuration control.

The Navy is currently developing the Automated Maintenance Environment (AME). It is designed to contain a configuration management module. SDT's configuration management module, or one like it, could be incorporated in AME. By incorporating SDT's Configuration Management system into AME we may be able to contribute to the Navy's goal of maintaining "affordable readiness" by using a system that has already been developed and has proven its merits to the civilian world. The Navy does not need to purchase another hardware system. There have already been many systems fielded with varying levels of success. We should be pursuing software solutions that are compatible with existing personal computers. Why should we develop our own system when we can profit from the lessons learned by the commercial world and not repeat their mistakes? Additionally, we should look to the commercial world for assistance with the development of our requirements for our follow on aviation maintenance support systems. In many cases, they are performing research on new technologies that we have just begun to think about. When it comes to aircraft maintenance, our missions are astonishingly similar. Whether the mission is carrying bombs over the beach to a target or passengers to their destination, the requirement for an operational aircraft with full logistic support that will perform

the mission and return to base safely is the same for all of us. We should take advantage of these similarities with industry and use them to make our maintenance support more effective and efficient.

B. RECOMMENDATIONS

I have five specific recommendations.

1. **NAVAIRSYSCOM should consult with members of industry, such as SABRE Decision Technologies, who have demonstrated experience in successfully re-engineering commercial aircraft maintenance support processes to study the Configuration Management Policy at NAVAIR.** The goal of the study would be to re-engineer NAVAIR's Configuration Management Policy to streamline the process, eliminate redundancy, improve communication and serve the needs of the customer in the fleet.
2. **Program Managers must be given a tool to ensure that they have accurate asset visibility to effectively manage all configuration changes that affect their programs.** The Program Manager has been given the responsibility of managing his/her program from "cradle to grave". I recommend that the Program Manager, with support from the Logistics and Engineering competencies, be given a process that is supported by an information system like the SDT Configuration Management system to manage his/her program's configuration management policy to meet the needs of the fleet.
3. **Configuration changes that are not mandatory to meet an Operational Requirement and/or are not mandatory for safety of flight should not be considered for incorporation.** I recommend that proposed changes to any configuration be reviewed by the

program office and the fleet to ensure that they are required for safety of flight or to meet an existing operational requirement (OR) before configuration change request packages are prepared. Any changes that do not meet one, or both of those criteria should not be brought before the Program Manager for forwarding to the Configuration Change Board (CCB).

4. **Solicit support from SABRE Decision Technologies, or a similar firm, to assist with the integration of a configuration management module to The Automated Maintenance Environment (AME).** AME is in the developmental stages. I recommend that the SDT Configuration Management System, or one like it, be integrated to operate with AME. This would be an excellent test to determine the potential for adapting commercial software applications to future military maintenance management systems.
5. **Stop using precious resources to perform research and development on maintenance management systems that already exist in the commercial world.** I recommend that we eliminate funding for research and development of decision support systems for maintenance/logistics support. Our professional operators and support staffs know the requirements of the fleet. They should define the requirements and then look to industry to show us how to maximize our future capabilities. As discussed earlier, there are strong parallels between the U.S. military aviation maintenance procedures and procedures used for commercial aviation. The commercial processes have evolved to maximize capacity/output and minimize cost/downtime. **Can we afford to do anything less?**

APPENDIX A. SAMPLE DECISION MEMORANDUM

MEMORANDUM

From: PMAXXX
To: Distribution

Subj: DECISION MEMORANDUM FOR GRUMMAN ECP NO. GR-EA-6B-270;
CANOPY JETTISON HANDLE SAFETY LATCH DATED 1 TUBER 1988

Note: Subject matter will be unclassified and must include the name of the ECP Originator and the configuration item affected.

Ref: (a) NAVAIRINST 4130.1C

Encl: (1) Draft Milestone Chart

1. The purpose of the subject ECP is to prevent inadvertent jettison of the EA-6B canopy during normal flight operations.
2. As required by reference (a), an ECP evaluation/planning conference was held on 10 October 1988 with representatives from the Contracts Division (AIR-2XXX), the Aviation Systems Training Program Office (PMA205XXX), the Logistics Management Division (AIR-4XXX), and the Systems Engineering Division (AIR-5XXX). Since the proposed ECP addressed both production and retrofit requirements and would require government furnished equipment, a representative from the Production Management Division (AIR-114) was also in attendance. It was also determined that a Program Management Proposal (PMP) and Approval for Production (AFP) would be required prior to this change being approved and incorporated.
3. As a result of this ECP evaluation/planning conference the following actions were assigned:
 - a. PMAXXX (configuration manager, etc.) will be responsible for coordinating program management proposal and production approval requirements with AIR-801 and AIR-1003, and obtaining the required concurrences.
 - b. PMAXXX will also be responsible for preparing the draft Justification and Approval (J&A) in narrative form and monitor its approval status. Technical program personnel will assist the program office as may be required.

c. AIR-02XXX will prepare the smooth J&A utilizing the draft inputs provided by the program office. AIR-02XXX will also assist PMA XXX in obtaining the required approvals.

d. AIR-04XXX will staff the change following AIR-04 internal procedures and will prepare and provide PMA XXX the applicable Cost and Funding Summary and Milestone Chart for inclusion into the formal CC3 Change Request/Directive. The APML will also coordinate the proposed change with AIR-552 (Support Equipment) and PMA 205 (Aviation Systems Training).

e. AIR-05XXX will staff the change following AIR-05 internal procedures and will prepare and provide PMA XXX the CCB Change Request Directive (NAVAIR 4130/1). AIR-05XXX will also coordinate with AIR-04XXX, AIR-114 and PMA205 as applicable.

f. PMA205XXX will coordinate and provide all aviation training inputs to AIR-04.

g. AIR-114XXX will provide AIR-05XXX with a completed GFE requirements form for supporting the proposed change.

5. The staffing and implementation of the subject ECP will be based on the following guidance:

- a. NAVAIRHQ Routing Priority: Routine
- b. Desired Production Effectivity: Serial No. P-72
- c. Funding identified and reserved:

APN-1 thru 4	\$ XXX,XXX.XX
APN-5	\$ XXX,XXX.XX
APN-6	\$ XXX,XXX.XX
O&MN	\$ XXX,XXX.XX

6. This change will be presented to the NAVAIR Change Control Board on XX/XX/XX. Staffing of the subject ECP must be completed and all inputs provided to PMA XXX by XX/XX/XX.

7. A draft milestone chart (NAVAIR 4130/3) identifying the planned implementation of the change is provided as enclosure (1).

Cognizant Field Activities (NAC, NAEC, PMTC, etc.)

ENDORSEMENTS:

APPENDIX B. FORMS REQUIRED FOR THE PREPARATION OF CCB CHANGE PACKAGES

A Change Control Board change request/directive must be prepared and processed for all Class I engineering change proposals (including value engineering change proposals), requests for major/critical deviations or waivers, RAMEC's, MGFEL's, work completion date extensions, and revisions and/or documents thereto. The chart below identifies which forms or documents must be completed and included in a final change request/directive package, when processing one of the following types of change control board actions.

<u>TYPES OF CHANGES</u>		<u>ECP</u>	<u>RFD</u>	<u>RFW</u>	<u>RAMEC</u>	<u>MGFEL</u>
<u>CCB CHANGE REQUEST/DIRECTIVE FORMS:</u>						
1.	NAVAIR CCB Change Request/Directive (NAVAIR 4130/1) Exhibit 6-5	X	X	X	X	X
2.	Cost and Funding Summary (NAVAIR 4130/2) Exhibit 6-6	X			X	* X
3.	Milestone Chart (NAVAIR 4130/3) Exhibit 6-7	X	X	X	X	X
4.	Implementing Instructions (NAVAIR 4130/4) Exhibit 6-8	X	X	X	X	X
5.	CCB Change Request/Supplement (Government Furnished Equipment Requirements (FY__)) (NAVAIR 4130/5) Exhibit 6-9	* X				
6.	Master Government Furnished Equipment List (MGFEL) Change (NAVAIR 4130/6) Exhibit 6-10	* X				X
7.	Support Equipment Requirements Form (NAVAIR 4130/7) Exhibit 6-11	* X				
8.	CCB Change Request/Directive AIR-04 Staffing/Concurrence Form (NAVAIR 4130/8) Exhibit 6-12	X	X	X	X	X
9.	CCB Change Request/Directive AIR-05 Staffing/Concurrence Form (NAVAIR 4130/9) Exhibit 6-13	X	X	X	X	X
10.	Controlling Custodian (TYCOM) ECP Incorporation Plan Form (NAVAIR 13061/9) Exhibit 6-14	** X				X
11.	CCB System Safety Assessment Form (NAVAIR 4130/10) Exhibit 6-15	X				
12.	Decision Memorandum, Exhibit 6-3	X	X	X		X
* If Affected						
** O & I Level Installations Only						
ECP:	Engineering Change Proposal					
RFD:	Request for Deviation					
RFW:	Request for Waiver

 B. A1-F18AC-560-500, DTD 1 MAY 93
 C. A1-250AC-560-000, DTD 15 APR 86
 4. PURPOSE: TO MODIFY ADC, P/N (07187) 4031000-912 TO P/N (07187)
 4031000-915. THIS CHANGE IS TO BE ACCOMPLISHED IN CONJUNCTION WITH
 F/A-18 AVB 561, WHICH REQUIRES INSPECTION FOR ADC POWER SUPPLY, P/N
 4031003-915 AND REQUIRES MODIFICATION OF ALL 4031003-902 POWER
 SUPPLIES TO THE -915 CONFIGURATION.
 5. APPLICATION: (FMS REFER PARA 15.C)
 A. BASIC EQUIPMENT: (LESS ATTRITION)

NOMEN	TYPE	PART NR	NSN	CAGE	SER	NRS	QTY	NOTE

(6) REMOVE THE (2) FROM PART NUMBER 4031005-912 ON THE MEMORY CCA WITH ACETONE. CLEAN AREA WITH CLEANING COMPOUND. ALLOW A FEW MINUTES FOR EVAPORATION. USING BLACK STENCIL INK, CHANGE PART NUMBER OF MEMORY CCA TO 4031000-915 BY MARKING (5) IN AREA WHERE (2)

WAS REMOVED.

(7) APPLY INSULATING COMPOUND TO ALL MODIFIED AREAS ON MEMORY CCA PER REF E WP 006 00.

(8) TEST MEMORY CCA REF DES A5 ON HTS, TPS ID 20414.

(9) REINSTALL MEMORY CCA REF DES A5 INTO ADC PER REF F WP 003 00.

(10) REMOVE OUTPUT DATA CONVERTER (ODC) CCA REF DES A10 PER REF F WP 003 00.

(11) REMOVE INSULATING COMPOUND OVER CAPACITOR REF DES C3, RESISTOR REF DES R52, AND LAST TWO NUMBERS (06) FROM PART NUMBER 4031010-906 WITH ISOPROPYL ALCOHOL AND FOAM SWAB PER REF E WP 006 00. REFER TO REF F WP 010 00 FOR LOCATION OF C3 AND R52 ON ODC CCA REF DES A10.

(12) UNSOLDER AND REMOVE CAPACITOR REF DES C3 AND RESISTOR REF DES R52 FROM ODC CCA A10 PER REF E WP 007 00.

(13) SOLDER CAPACITOR, P/N M39003/01-6209, IN C3 LOCATION AND RESISTOR, P/N RNC55H1433FS, IN R52 LOCATION PER REF E WP 007 00.

(14) REMOVE THE (06) FROM PART NUMBER 4031010-906 ON THE ODC CCA WITH ACETONE. CLEAN AREA WITH CLEANING COMPOUND. ALLOW A FEW MINUTES FOR EVAPORATION. USING BLACK STENCIL INK, CHANGE PART NUMBER OF ODC CCA TO 4031010-913 BY MARKING (13) IN AREA WHERE (06) WAS REMOVED.

(15) APPLY INSULATING COMPOUND TO ALL MODIFIED AREAS ON ODC CCA PER REF E WP 006 00.

(16) TEST ODC CCA REF DES A10 ON HTS, TPS ID 20418.

(17) REINSTALL ODC CCA REF DES A10 INTO ADC PER REF F WP 003 00.

(18) REMOVE POWER SUPPLY REF DES A3 PER REF F WP 003 00.

(19) DISASSEMBLE CHASSIS PER REF F WP 012 00 TO PROVIDE ACCESS TO ELECTRONIC COMPONENT ASSEMBLY (ECA) A12A1.

(20) UNSOLDER AND REMOVE RESISTOR, P/N RNC55H2001FS, REF DES A12A1R1, FROM TERMINALS A12A1-21 AND A12A1-22 PER REF E WP 007 00. REFER TO REF E WP 012 00 FIGURE 8 TO LOCATE RESISTOR A12A1R1.

(21) SOLDER RESISTOR, P/N RNC55H5111FS, IN A12A1R1 LOCATION BETWEEN TERMINALS A12A1-21 AND A12A1-22 PER REF E WP 007 00.

(22) REASSEMBLE CHASSIS PER REF F, WP 012 00.

(23) PERFORM AVB 561.

(24) REMOVE EXISTING ADC ID PLATE, P/N 4031017-10, BY APPLYING A FEW DROPS OF MEK OR EQUIVALENT TO UPPER EDGE OF PLATE. WORK MEK OR EQUIVALENT DOWN INTO ADHESIVE WHILE GRADUALLY PULLING ID PLATE AWAY FROM CHASSIS.

(25) PREPARE SURFACE WHERE ADC ID PLATE IS TO BE APPLIED BY CLEANING WITH CLEANING COMPOUND.

(26) REMOVE BACKING FROM NEW ID PLATE, P/N 4031017-10. POSITION PLATE ON CHASSIS AND FIRMLY PRESS SURFACE TO ENSURE GOOD ADHESION.

(27) MARK AVC 4651 ON ADC ID PLATE USING WHITE INK.

(28) INSTALL ADC TOP COVER AND TIGHTEN THE TWELVE CAPTIVE SCREWS PER REF F WP 003 00.

(29) PERFORM ADC FUNCTIONAL TEST ON IATS OR ATS, TPS ID 74D050021.

C. ORGANIZATIONAL LEVEL:

(1) VERIFY AVC 4651 IS MARKED ON ADC ID PLATE AND AN AVB 561 DECAL IS APPLIED ON MODIFIED ADC, P/N 4031000-915.

(2) INSTALL ADC IN AIRCRAFT PER REF D WP 003 00.

(3) CLOSE DOOR 13R PER REF C WP 006 01.

(4) RETURN AIRCRAFT TO FLIGHT STATUS OR AS DIRECTED BY MAINTENANCE CONTROL.

11. WEIGHT AND BALANCE: THE EFFECT ON WEIGHT AND BALANCE IS CONSIDERED NEGLIGIBLE.

12. RECORDS AFFECTED:

1	AA4034246-524	07187	PROM	5962-01-154-7550	D1

10. DETAILED INSTRUCTIONS:

A. ORGANIZATIONAL LEVEL:

(1) REMOVE ELECTRICAL AND HYDRAULIC POWER PER REF A WP 004 00 AND WP 009 00.

(2) INSTALL APPLICABLE SAFETY AND PROTECTIVE DEVICES PER REF B WP 022 00, WP 023 00 AND WP 024 00.

(3) OPEN DOOR 13R PER REF C, WP 006 01.

(4) REMOVE ADC, P/N 4031000-912, PER REF D WP 003 00;
INSTALL CONDUCTIVE DUSTCAP OR ANTISTATIC GRID TAPE TO ADC CONNECTOR RECEPTACLE FOR ELECTROSTATIC DISCHARGE (ESD) PROTECTION; AND INDUCT ADC INTO INTERMEDIATE LEVEL MAINTAINANCE FACILITY FOR MODIFICATION.

B. INTERMEDIATE LEVEL:

CAUTION

THE ADC CONTAINS ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES WHICH CAN BE DAMAGED OR DESTROYED BY IMPROPER HANDLING, REPAIR, OR TESTING PROCEDURES. PERSONNEL SHALL BE FAMILIAR WITH THE REQUIREMENTS OF REF E WP 005 00.

(1) LOOSEN THE TWELVE CAPTIVE SCREWS AND REMOVE THE TOP COVER FROM THE ADC PER REF F WP 003 00.

(2) REMOVE MEMORY CCA REF DES A5, P/N 4031005-912, PER REF F WP 003 00.

(3) REMOVE INSULATING COMPOUND FROM PROMS U1 THRU U12 AND THE (2) OF PART NUMBER 4031005-912 WITH ISOPROPYL ALCOHOL AND FOAM SWAB PER REF E WP 006 00. REFER TO REF F WP 006 00 FOR LOCATION OF U1 THRU U12 ON MEMORY CCA REF DES A5.

(4) UNSOLDER AND REMOVE -511 THRU -522 EXISTING PROMS U1 THRU U12 FROM MEMORY CCA REF DES A5 PER REF E WP 007 00.

(5) SOLDER NEW -621 THRU -642 PROMS U1 THROUGH U12 ON MEMORY CCA REF DES A5 PER REF E, WP 007 00 AS FOLLOWS:

U1	-	AA403246-621
U2	-	AA403246-622
U3	-	AA403246-623
U4	-	AA403246-624
U5	-	AA403246-625
U6	-	AA403246-626
U7	-	AA403246-627
U8	-	AA403246-628
U9	-	AA403246-629
U10	-	AA403246-630
U11	-	AA403246-641

7. SUBMIT VES/MAF, OPNAV FORM 4750/50, WHEN REPORTING COMPLIANCE WITH THIS DIRECTIVE.

B. MAKE APPROPRIATE LOGBOOK ENTRY IN TECHNICAL DIRECTIVES SECTION, OPNAV 4790724A AND/OR IN ATDR LIST NUMBER 2 AND LIST NUMBER 4, AS APPLICABLE.

13. VERIFIED BY: MALS ELEVEN PER THEIR MESSAGE 080301Z JUN 95 ON ADC S/N NJR00009.

14. RESCISSION DATE: 30JUN2001

15. RELATED INSTRUCTIONS/INFORMATION:

A. NADEP N.I. RAMEC 03-95 SUBMITTED BY REF H WAS NAVAIR APPROVED BY CCB 961-0084 ON 04JAN96.

B. THIS TD WILL NOT BE FORMALIZED. FILE THIS COPY IN APPROPRIATE TECHNICAL DATA FILE.

C. MDA HAS REVIEWED THIS RAMEC WITH RESPECT TO FMS EFFECTIVITY AND HAS FOUND:

(1) APPLICATION TO BASIC EQUIPMENT

(b) NAVAIR CCB No. 941-0094 approved 18 Jan 94
(c) NAVAIR 02B-105AHE-6-1 Intermediate Maintenance Manual,
Rapid Action Change 17 of 14 Dec 93

ENCLOSURE: Not applicable

DOCUMENTATION AFFECTED:

1. NAVAIR 02B-105AHE-4 Illustrated Parts Breakdown, Rapid Action Change 1 of 8 Apr 93
2. NAVAIR 02B-105AHE-6-1 Intermediate Maintenance Manual, Rapid Action Change 17 of 14 Dec 93
3. NAVAIR 02B-105AHE-6-2 Depot Maintenance Manual, Change 10 of 15 Oct 91

PURPOSE OF DIRECTIVE: This directive introduces/preformed packings (O-rings) of improved material (Kalrez 4079) for the No. 3 Bearing Sump area of the T58-GE-16. Kalrez 4079 has characteristics more compatible with the engine sump environment, thus providing extended O-ring life and reducing the possibility of oil leakage due to high temperature degradation of the O-ring. This change was proposed by reference (a) and approved by reference (b).

APPLICATION:

1. BASIC EQUIPMENT:

The following engines shall be modified by service activities.

<u>TYPE/MODEL/SERIES</u>	<u>CONTRACT NO.</u>	<u>SERIAL NO.</u>
T58-GE-16	N00019-90-G-C237	216001 - 216999

2. TRAINERS: Not Applicable.

3. SPARES: Not Applicable.

COMPLIANCE:

1. This change shall be accomplished by retrofit at Intermediate and Depot levels on next exposure to level required to incorporate.

0870LD6641588

T58-PPC-158

T58 POWER PLANT CHANGE NO. 158

2. Incorporation shall be done by the following activities:

ORGANIZATIONAL MAINTENANCE ACTIVITIES: Information only.

INTERMEDIATE MAINTENANCE ACTIVITIES: Comply with detailed instructions on all engines at next exposure to level required to incorporate.

DEPOT MAINTENANCE ACTIVITIES: Comply with detailed instructions on all engines at next exposure to level required to incorporate.

SUPPLY ACTIVITIES: Provide normal support.

MAN-HOURS REQUIRED:

<u>KIT IDENT NO.</u>	<u>KIT NO.</u>	<u>NO. OF MEN</u>	<u>SKILL</u>	<u>TOTAL M/HR</u>
9158LKA129778EQ (GE P/N 1935T72G01)	A1	1	Engine Mech	0.5

SUPPLY DATA:

1. REQUIREMENTS FOR BASIC EQUIPMENT:

a. Kit required:

<u>QTY</u>	<u>P/N</u>	<u>CAGE</u>	<u>NOMENCLATURE</u>	<u>SM&R</u>	<u>NSN</u>	<u>SOURCE</u>
1	9158LKA129778EQ (GE P/N 1935T72G01)	99207	Retrofit Kit	6" X 12"	1 lb	(1)

Consists of:

Disposition: (A) Dispose of through local Property Disposal Officer.
 (B) Retain for use, provided that part meets inspection requirements of reference (c). If part does not meet inspection requirements, replace part through normal channels.

2. REQUIREMENTS FOR TRAINERS: Not applicable.

3. REQUIREMENTS FOR SPARES: Not applicable.

REIDENTIFICATION: Not applicable.

DETAILED INSTRUCTIONS:

1. Screen engine logbook for compliance with this directive. If this directive has not been complied with, proceed as follows when installing oil nozzle, oil scavenge tube, and oil-in tube in second stage turbine casing during engine assembly.

2. Installation of No. 3 Bearing Sump Oil Nozzle, P/N 4023T80G01, and Preformed Packing, P/N 4074T58P17.

NOTE

Ensure oil nozzle meets inspection requirements of reference (c) prior to installation. If wear or damage exceeds limits, replace nozzle.

a. Lubricate new Preformed Packing (15, Figure 1), P/N 4074T58P17, with Oil, MIL-L-23699. Install packing on Oil Nozzle (14), P/N 4023T80G01. Relubricate packing and install nozzle in No. 3 Sump Bearing Housing (12), P/N 6012T65G02/G04. Secure nozzle with two Screws (13), P/N R1468P007L. Torque screws to 13-16 in-lb.

CAUTION

Safety wire must not obstruct the oil-in tube hole.

b. Safety wire (0.020 inch) the two screws, using the double twist method.

c. Continue processing in accordance with reference (c).

3. Installation of No. 3 Bearing Scavenge Tube Assembly, P/N 4009T20P01, and Preformed Packings, P/N 4074T58P13.

NOTE

Ensure heat shield and scavenge tube meet inspection requirements of reference (c) prior to installation. If wear exceeds limits, replace part. Replace any heat shields that contain holes.

T58 POWER PLANT CHANGE NO. 158

a. Lubricate two new Preformed Packings (16, Figure 1), P/N 4074T58P13, with Oil, MIL-L-23699. Install packings in scavenge boss on No. 3 Sump Bearing Housing, P/N 6012T65G02/G04 (12), ensuring packings are not pushed past groove and into sump.

b. Proceed with Stage 2 turbine casing component buildup in accordance with reference (c), WP 030, paragraph 25, steps b through l, then proceed as follows.

CAUTION

Scavenge tube can cut packings if tool is not held securely against end of tube during tube installation.

c. Place Heat Shield (3, Figure 2), P/N 2007T51P01, on Scavenge Tube (6), P/N 4009T20P01. Lubricate Scavenge Tube Guide, P/N 21C4298G01 (7) and scavenge tube with Oil, MIL-L-23699. Install aft end of wire segment (8) of scavenge tube guide. Be sure conical plug segment (9) of scavenge tube guide is held securely against scavenge tube.

d. Using scavenge tube guide, insert scavenge tube and heat shield through stage 2 turbine casing (5), stage 3 nozzle (4), and preformed packings (2), at six o'clock position.

e. Remove scavenge tube guide and secure scavenge tube assembly, using coupling nut.

4. Installation of No. 3 Bearing Oil-in Tube, P/N 4018T02G01, and Preformed Packings, P/N 4074T58P16.

NOTE

Ensure heat shield and oil-in tube meet inspection requirements of reference (c) prior to installation. If wear exceeds limits, replace part. Replace any heat shields that contain holes.

a. Install Heat Shield (3, Figure 3), P/N 2007T51P01, over Oil-in Tube (5), P/N 4018T02G01. Lubricate two new Preformed Packings (6), P/N 4074T58P16, with Oil, MIL-L-23699, and install packings in groove on oil-in tube.

CAUTION

Heat shield can cut packing if shield is allowed to rest against packing during tube installation.

WARNING

Exercise caution during oil-in tube installation to prevent damage to preformed packings.

b. Lubricate packings with oil, MIL-L-23699. With casing raised so that shield will not contact packing, install oil-in tube in casing at four o'clock position. Secure with coupling nut on oil-in tube.

c. Continue processing in accordance with reference (c).

RECORDS AFFECTED:

1. Identify the change as T58 Power Plant Change 158. Make appropriate Power Plant logbook entry in the Technical Directive Section, OPNAV Form 4790/24A. Submit VIDS/MAF OPNAV Form 4790/60 when reporting compliance with this directive.

2. Component is not tracked by Scheduled Removal Component card. No SRC card entry required.
